

Install the App Certificate — Phone

GSSG Manager · one-time setup (about 2 minutes)

To open the app at <https://gssgit.local> on your phone, you install a small security certificate **once**. This is safe — it just tells your phone to trust our office server. You only do this a single time per device.

First: get the file `gssg-ca.crt` onto your phone — the easiest ways are **AirDrop** (iPhone), or **email it to yourself** and open it on the phone, or download it from a shared folder.

iPhone / iPad

- 1 Get the file `gssg-ca.crt` onto the phone (AirDrop or email), then **tap it**. You'll see a message: *"Profile Downloaded"*.
- 2 Open `Settings` → `General` → `VPN & Device Management`.
- 3 Under **Downloaded Profile**, tap the profile named **"Caddy Local Authority"**.
- 4 Tap **Install** (top-right) → enter your phone passcode → tap **Install** again to confirm.
- 5 Now the important extra step: go to `Settings` → `General` → `About` → `Certificate Trust Settings`.
- 6 Turn **ON** the switch next to **"Caddy Local Authority"**, then tap **Continue**.
- 7 Open **Safari** and go to <https://gssgit.local>. ✓ The app loads with a padlock and no warning.

Don't skip step 5–6. On iPhone the certificate is not trusted until you turn on the switch under **Certificate Trust Settings**. Without it, Safari will still show "Not Secure".

Android

- 1 Get the file `gssg-ca.crt` onto the phone (email it to yourself, USB cable, or

download).

- 2 Open `Settings` and search for **"CA certificate"** (or go to `Security` → `More security settings` → `Encryption & credentials`).
- 3 Tap **Install a certificate** → **CA certificate**.
- 4 If a warning appears, tap **Install anyway**, then browse to and select `gssg-ca.crt` .
- 5 You'll see *"Certificate installed"* / *"CA certificate is installed"*.
- 6 Open **Chrome** and go to `https://gssgit.local` . ✓ **The app loads with a padlock.**

Menus look different? Android wording varies by brand (Samsung, Xiaomi, Oppo...). Just open Settings and **search "CA certificate"** — that always finds the right screen.

? If it still doesn't open

- 1 Make sure the phone is on the **same Wi-Fi** as the office (not mobile data, not a guest network).
- 2 Type the address exactly: `https://gssgit.local` (with the **https**).
- 3 Still stuck? Try `https://gssgit.local/` (with a slash), or ask IT to confirm the certificate shows as **"Caddy Local Authority"** and is trusted.

GSSG Manager — internal LAN access guide. The certificate contains no passwords and is safe to install. Keep this for new devices.
