

Install the App Certificate — Windows PC

GSSG Manager · one-time setup (about 1 minute)

To open the app at <https://gssgit> on a Windows PC, install this small security certificate **once**. It simply tells Windows to trust our office server. Safe — it holds no passwords.

First: copy the file `gssg-ca.crt` onto the PC (USB drive, email, or a shared folder).

Install steps

- 1 **Double-click** the file `gssg-ca.crt`.
- 2 In the window that opens, click **Install Certificate...**
- 3 For **Store Location**, choose **Local Machine**, then click **Next**.
(Approve the admin / User Account Control prompt if it appears.)
- 4 Choose **"Place all certificates in the following store"**, then click **Browse...**
- 5 Select **"Trusted Root Certification Authorities"** → click **OK** → **Next** → **Finish**.
- 6 A security warning appears — click **Yes** to confirm.
- 7 You'll see *"The import was successful."* Click **OK**.
- 8 Open **Edge** or **Chrome** and go to <https://gssgit>. ✓ The app loads with a padlock and no warning.

"Local Machine" is greyed out / no admin rights? Choose **Current User** instead in step 3 — the rest of the steps are identical, and it works for your login.

Which address to use

- 1 <https://gssgit> — simplest, works on Windows.

2

`https://gssgit.local` — also works (and is what phones use).

? If it doesn't open

1

Make sure the PC is on the **same office network** as the server.

2

Type the full address with **https:** `https://gssgit`

3

If you see a certificate warning, the cert wasn't placed in "**Trusted Root Certification Authorities**" — repeat steps 4–5.

GSSG Manager — internal LAN access guide. The certificate contains no passwords and is safe to install. Keep this for setting up new PCs.
